

The Complete Curvaceous Solution to PAT

The whole solution to the FDA PAT (Process Analytical Technology) Initiative has finally arrived. It will be showcased by Curvaceous Software Ltd. at this years World Pharma IT Congress, September 27th and 28th at The Brewery, London. Award winning Geometric Process Control (GPC) technology can model an entire process step providing continuous quality assurance. Quality violations are prevented by precise operator real time guidance thus achieving the requirements of PAT. This novel technology has been used successfully in process industries such as food, chemicals and pharmaceuticals.

Curvaceous Software Limited has pioneered a method of portraying hundreds of variables on a single interactive graph. Not only does this allow multivariate relationships to be discovered with ease but it also heightens the process understanding of all involved, allowing in depth analysis of every part of the process. J. K from Pharmaceutical and Analytical R & D in Astra Zeneca is already a Curvaceous fan,

"Curvaceous Visual Explorer (CVE) is an easy and intuitive tool for rapidly extracting information from complex data sets. The highly visual approach of CVE makes the presentation of findings easy allowing decisions to be quickly reached as to which development route to follow."

Saving time and money is as important in the pharmaceutical industry as it is within the process industry as a whole. Curvaceous' process models with real time operator guidance are revolutionising the way operators react as confidence levels increase amongst users. Reduced waste and increased throughput are just a couple of the benefits being felt.

"Optimisation is the key and our products enable process potential to be reached and process goals extended beyond previous limitations. Take Alarms for example, we provide the first ever method for precise alarm limit setting. This helps us to help users push their process safely to its limits and reap the benefits of doing so." States Dr. Robin Brooks, Managing Director. "Curvaceously squeezing every inch of available operation and producing on specification product every time."

Winners of the European Process Safety Centre (EPSC) award for 'The Biggest Contribution to Improved Process Safety' 2003, Curvaceous are well aware that their technology breaks the mould of traditional analytical and modeling devices.
